AMENDMENTS TO THE CLAIMS:

1. (Previously Presented) Electrohydraulic pressing device suitable for one-handed operation, comprising: a working head, an electric motor, a pump, a hydraulic tank and a gear mechanism between the electric motor and the pump, a gripping region being provided around which a hand can be placed and with which an actuating switch is associated, characterized in that the gripping region is formed around the electric motor and the actuating switch is disposed on the working-head side of the electric motor.

2. (Previously Presented) Pressing device of claim 1, further comprising an emergency switch, wherein the gripping region is formed at the center of gravity of the device and the actuating switch and the emergency switch are formed lying oppositely on the device, appropriately for placement of an index finger/thumb.

3. (Previously Presented) Pressing device of claim 1, wherein the actuating switch is disposed away from an end face of the electric motor by the width of one to four fingers.

4. (Previously Presented) Pressing device of claim 1, wherein a one-sided widening of the device is formed at the end opposite from the working head.

5. (Previously Presented) Pressing device of claim 4, wherein the widening is partly formed by a storage battery.

6. (Previously Presented) Pressing device of claim 4, wherein the widening is formed such that it projects to the side on which the actuating switch is formed.

7. (Previously Presented) Pressing device of claim 1, further comprising a pump plunger, and wherein a center axis of the electric motor is in line with an axis of the pump plunger.

8. (Previously Presented) Pressing device of claim 7, further comprising a bypass valve disposed alongside the pump plunger.

9. (Previously Presented) Pressing device of claim 7, further comprising a hydraulic tank disposed around at least the pump plunger.

10. (Previously Presented) Pressing device of claim 1, further comprising a storage battery, wherein the storage battery can be inserted in an axial direction of the electric motor.

11. (Previously Presented) Pressing device of claim 1, further comprising a working head receptacle having a central axis wherein the working-head receptacle is aligned in line with a center axis of the electric motor.

12-21. (Cancelled)
